

Editorial (E)

Dear Reader

The present issue of JUPITER deals with the topic of the lemniscatory movements of the Sun, Earth and Planets; a subject which will also be addressed by the next conference of the Section for Mathematics and Astronomy at the Goetheanum in October 2010.

Rudolf Steiner referred to the lemniscatory movements of the celestial bodies in different contexts. He thus indicated a new perception of the cosmos, compared to the presently valid world system of Copernicus and Kepler.

Several Anthroposophists have dealt with those indications of Rudolf Steiner. And so, there are already various solutions to this setting of a task.

In this issue HERMANN BAUER, NICK THOMAS and ROLAND SCHRAPP are presenting the results of their work on this topic. Hermann Bauer has also published the book *Über die lemniskatischen Planetenbewegungen. Elemente einer Himmelsorganik* issued in 1988 by the Verlag Freies Geistesleben.

In case one or the other reader feels inspired to comment on an article or to deliver a new insight, please send your text to the editor of JUPITER.

BENGT ULIN coordinated the activities for the Section for Mathematics and Astronomy in Sweden for a long time. We are looking back to that time with a short article and an interview.

This issue closes with references to the little book *Fortuna und Kalkül. Zwei mathematische Belustigungen* by H.-M. Enzensberger and the English translation of H. Warms *Die Signatur der Sphären* as well as two announcements in the Forum by BEN VAN TILBORG and WOLFGANG

WIEBECKE and a contribution by RALPH DANYLUK.

Dear reader, I hope you will enjoy reading the present issue of JUPITER.

Sincerely Yours,
Oliver Conradt
